# FINDING STUDY ON THE CORRELATION BETWEEN THE INDICES OF PHYSICAL DEVELOPMENT OF PRIMARY SCHOOL STUDENTS 

Grosu Bogdan-Marius,<br>Stefan cel Mare University of Suceava, Romania

Key Words: correlation, indicator, physical development, students, primary cycle.

#### Abstract

Sustained research into the morphological and functional growth and development of children is one of the tasks of great responsibility of parents, doctors and teachers. Knowing the changes that occur in the body by age and sex, we can see if the evolution of a community is within normal limits or exceeds these limits.

\section*{Introduction}

A topic of permanent topicality, the motor and somato-functional potential of man has preoccupied and continues to concern specialists in the field of physical education and school sports, pre-university, sports medicine, public health and other fields. From the point of view of the biomotor potential, the specialists unanimously agree that the state of health is conditioned by the biological, motor resources of the individual. [7] The so-called "physical fitness" (motor capacity) creates a healthy, balanced "internal environment", a state of physical and mental wellbeing. [6] The criteria and methods of knowing these evolutions as well as the appreciation of the changes that take place in different phases of the growth and development of the body are very varied. [8]. By evaluating the biomotor potential we obtain valuable information about the physical development of the individual, about the existence of possible deficient attitudes of the musculoskeletal system, as well as information about the physical condition (characterized by indications of strength, coordination, balance, speed under different forms, suppleness) which is, from my point of view, the platform for the manifestation of other forms of health, with major influences in integration into the social environment. [9]

## Material-method

It is assumed that following the application of differentiated training programs for different categories of students we can obtain very
good results in improving the ratio between indicators of physical development and those of motor ability. [2] It is assumed that the use of exercise structures and methodical procedures appropriate to poor material conditions, can lead to harmonious physical development and efficient development of motor skills. [3]

The purpose of choosing this topic: characterizing the somatic, functional and motor potential of the students from the primary cycle of the school and identifying / establishing the level of manifestation of the components and the interrelationships between them, in this development cycle.
Class I girls
Height (m)

| Mediate <br> $(\mathrm{m})$ | Median <br> $(\mathrm{m})$ | Module <br> $(\mathrm{m})$ | Standard <br> deviation <br> $(\mathrm{m})$ | Maxim <br> $(\mathrm{m})$ | Minim <br> $(\mathrm{m})$ | Amplitu- <br> de <br> $(\mathrm{m})$ | Coef. of <br> variability <br> $(\%)$ | over/onder <br> mean <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1,224 | 1,22 | 1,22 | 0,03 | 1,29 | 1,17 | 0,12 | $2,4 \%$ | $44,48 \% /$ <br> $55,52 \%$ |

Conclusion: The average of the results obtained in the subjects when measuring the height is $1,224 \mathrm{~m}, 44.48 \%$ of which are above average. The most common value is 1.22 m , it is repeated in $22.22 \%$ of cases. The results vary between 1.17 m and 1.29 m , the amplitude being equal to 0.12 m . The dispersion has a homogeneous structure, with a standard deviation from the mean of 0.03 m and a coefficient of variation of $2.4 \%$. [5]

## Body height (kg)

| Mediate <br> $(\mathrm{kg})$ | Median <br> $(\mathrm{kg})$ | Module <br> $(\mathrm{kg})$ | Standard <br> deviation <br> $(\mathrm{kg})$ | Maxim <br> $(\mathrm{kg})$ | Minim <br> $(\mathrm{kg})$ | Amplitu- <br> de <br> $(\mathrm{kg})$ | Coef. of <br> variability <br> $(\%)$ | over/onder <br> mean <br> $(\%)$ |

The most common result is 145 cm , which is repeated in $33.33 \%$ of cases. The results obtained by the subjects vary between 130 cm and 150 cm , the amplitude being equal to 20 cm . The value of the coefficient of variation is $5.42 \%$ which means that the data
spread is very small, the average is representative and the measured sample is homogeneous from this point of view. [5]

## Class IV boys

Height (m)

| Mediate <br> $(\mathrm{m})$ | Median <br> $(\mathrm{m})$ | Module <br> $(\mathrm{m})$ | Standard <br> deviation <br> $(\mathrm{m})$ | Maxim <br> $(\mathrm{m})$ | Minim <br> $(\mathrm{m})$ | Amplitu- <br> de <br> $(\mathrm{m})$ | Coef. of <br> variability <br> $(\%)$ | over/onder <br> mean <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1,38 | 1,40 | 1,42 | 0,049 | 1,465 | 1,325 | 0,14 | 3,56 | $60 \% / 40 \%$ |

Conclusion: When measuring the average height of the results is equal to $1.38 \mathrm{~m}, 60 \%$ of them are above average. The most common value is 1.42 m , this represents $30 \%$ of the results obtained by the subjects, results that vary between 1.325 m and 1.465 m , the amplitude being equal to 0.14 m . The dispersion has a homogeneous structure, with a standard deviation from the mean of 0.049 m and a coefficient of variation of $3.56 \%$. [5]

## Body height (kg)

| Mediate <br> $(\mathrm{m})$ | Median <br> $(\mathrm{m})$ | Module <br> $(\mathrm{m})$ | Standard <br> deviation <br> $(\mathrm{m})$ | Maxim <br> $(\mathrm{m})$ | Minim <br> $(\mathrm{m})$ | Amplitu- <br> de <br> $(\mathrm{m})$ | Coef. of <br> variability <br> $(\%)$ | over/onder <br> mean <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 36,2 | 35 | 32 | 3,87 | 42 | 32 | 10 | 10,7 | $40 \% / 60 \%$ |

Conclusion: The average value of the results obtained by the subjects when measuring body weight is equal to $36.2 \mathrm{~kg}, 40 \%$ of the results are above average. The most common result is 32 kg , which is repeated in $30 \%$ of cases. The results obtained by the subjects vary between 32 kg and 42 kg , the amplitude being equal to 10 kg . The value of the coefficient of variation is $10.7 \%$ and the standard deviation is 3.87 kg which means that the data scatter is relatively small, the average being sufficiently representative, the sample can be considered homogeneous from this point of view. [5]

Amplitude (cm)

| Mediate <br> $(\mathrm{m})$ | Median <br> $(\mathrm{m})$ | Module <br> $(\mathrm{m})$ | Standard <br> deviation <br> $(\mathrm{m})$ | Maxim <br> $(\mathrm{m})$ | Minim <br> $(\mathrm{m})$ | Amplitu- <br> de <br> $(\mathrm{m})$ | Coef. of <br> variability <br> $(\%)$ | over/onder <br> mean <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 140,05 | 142 | 143 | 4,16 | 145 | 132 | 13 | 2,97 | $70 \% / 30 \%$ |

Conclusion: The average value of the results obtained by the subjects when measuring the magnitude is equal to $140.05, \mathrm{~cm}, 70 \%$ of the results are above average. The most common result is 143 cm , which is repeated in $30 \%$ of cases. The results obtained by the subjects vary between 132 cm and 145 cm , the amplitude being equal to 13 cm . The value of the coefficient of variation is $2.97 \%$, the standard deviation is 4.16 cm , which means that the data scattering is very small, the average is representative, the measured sample being homogeneous from this point of view. [5]

## Conclusions

It is found that from an anthropometric point of view the classes of students are homogeneous (except for the third grade for both girls and boys, in the weight indicator $\mathrm{V}>15 \%$ data scattering is average and the average is quite representative) standard deviation ( S ) and the coefficient of variation ( V ) falling between the following values:

- For height:- girls $S=0,03-0,05 m ; V=2,4-3,89 \%$

$$
\text { - boys } \mathrm{S}=0,02-0,09 \mathrm{~m} ; \mathrm{V}=2,22-6,69 \%
$$

- For body height : - girlsS $=3,13-12,24 \mathrm{~kg} ; \mathrm{V}=13,45-33,49 \%$

$$
\text { - boys } \mathrm{S}=3,23-9,83 \mathrm{~kg} ; \mathrm{V}=10,7-25,21
$$

- For amplitude: - girls $\mathrm{S}=3,78-7,77 \mathrm{~cm} ; \mathrm{V}=2,97-5,59 \%$

$$
\text { - boys } S=4,16-6,16 \mathrm{~cm} ; \mathrm{V}=2,97-5,43 \%
$$
